Surgical Pathology Report (Colorectal)

Template v1.0.0 · Generated 2026-10-20T04:13:38+00:00 · Status signed · Mode rules

Case No.	SP-2026-004521
Tumour site *	sigmoid colon
Operative procedure *	laparoscopic anterior resection
Histological tumour type *	adenocarcinoma, not otherwise specified
Histological tumour grade *	moderately differentiated
Tumour dimension *	3.5 x 2.8 x 1.2 cm
Perforation *	not identified
Relation of tumour to anterior peritoneal reflection *	not applicable
Plane of mesorectal excision *	not applicable
Extent of invasion *	tumour invades through muscularis propria into subserosa
Lymphatic and venous invasion *	not identified
Perineural invasion *	present
Lymph node status *	2 out of 16 lymph nodes show metastatic carcinoma
Tumour deposits *	absent
Proximal margin *	free of tumour, 6.0 cm from tumour
Distal margin *	free of tumour, 4.5 cm from tumour
Circumferential margin *	free of tumour, 1.2 cm
MACROSCOPIC EXAMINATION	The specimen consists of a segment of sigmoid colon measuring 18.0 cm in length and 4.0 cm in diameter. An ulcerated tumour measuring 3.5 x 2.8 x 1.2 cm is identified 6.0 cm from the proximal resection margin. The serosal surface is not involved by tumour and multiple lymph nodes are found in the mesocolic fat.
MICROSCOPIC EXAMINATION	Sections show a moderately differentiated adenocarcinoma with glandular formation, invading through the muscularis propria into the subserosal adipose tissue. The tumour cells show moderate nuclear pleomorphism and no lymphatic or venous permeation is identified. Metastatic carcinoma is present in 2 of 16 lymph nodes and the remaining lymph nodes show reactive changes. Sections of the proximal, distal and circumferential resection margins are free of tumour.
DIAGNOSIS *	Sigmoid colon, laparoscopic anterior resection: moderately differentiated adenocarcinoma, not otherwise specified, tumour invades through muscularis propria into subserosa. [auto-generated]
